This polypeptide comprises major peanut allergen Ara hII. Its sequence was deduced from a cDNA clone (AAT76615) isolated from peanut seed cDNA asing a primer (see AAT76617) based on an isolated Ara hI peptide (see AAM24151). The sequence shows significant homology with the conglutin family of seed storage proteins of other legumes. The allergen is recognised by serum igg from a large proportion of individuals with peanut hypersensitivity. Ara hII and Ara hI (see AAM24149-50) can be used to raise monoclonal antibodies which are used in a specific two-site MAb BILSA for the detection of Ara hI or Ara hII (claimed). Igs. binding Ara hII antigen epitopes (see AAW24188-93) may be used in vaccines to protect against allergic reactions to peanut allergens, e.g. anaphylactic shock. (Updated on 17-0CT-2003 to standardise OS field)

```
This polypeptide comprises major peanut allergen Ara hII. Its sequence was deduced from cDNA clone P38 (AAT76614), isolated from peanut seed clone using a primer (see AAT76614) based on an isolated Ara hI peptide (see AAW24151). The sequence shows significant homology with the conglutin family of seed storage proteins of other legumes. The allergen is recognised by serum 1gE from a large proportion of individuals with peanut hypersensitivity. Ara hII and Ara hI (see AAW24149-50) can be used to raise monoclonal antibodies which are used in a specific two-site MAD ELISA for the detection of Ara hI or Ara hII (claimed). IgE- binding Ara hII antigen epitopes (see AAW24188-93) may be used in vaccines to protect against allergic reactions to peanut allergens, e.g. anaphylactic shock. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       241

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        hypogea. The Ara h 2 protein has 10 IgE (Immunoglobulin E) binding epitopes, three of which are immunodominant (AAY15272, AAY15275, and AAY15276). By modifying the IgE binding sites the ability of the allergen to provoke an immune response is downregulated. The epitopes of the IgE binding sites can therefore be modified in genetically engineered plants and animals to elicit less of an allergic response. (Updated on 17-OCT-2003 to standardise OS field)

```
antigenic peptides having a reduced ability to bind immunoglobulin E (IGE) as compared with the intact (A), or having a sequence substantially identical to a portion of sequence of an antigen that includes at least one IGE binding site, where at least one IGE binding site of the peptide is a sequence. The antigenic peptides are used in a composition which is useful for reducing risk or severity of allergic reaction to an antigen by identifying an individual at risk of allergic reaction to an antigen by identifying an individual at risk of allergic reaction to an antigen by identifying prior display of allergic symptoms when exposed to the antigen, or a familial relationship with an individual who previously displayed allergic symptoms when exposed to the antigen. Cor basophils in the individual's serum is identified. The individual is then contacted with a peptide corresponding to a portion of the antigen. Which is selected, formulated, and delivered so that binding of the which is allergic reactions is also useful for treating and contact antigen. The composition is also useful for treating and corresponding as compared with IgE binding of the peptide to antigen. The composition is also useful for treating and

The invention relates to a modified anaphylactic food allergen has an amino acid sequence that is substantially identical to that of natural anaphylactic food allergen, except for a cysteine residue that has been modified so that it cannot participate in the disulphide bond. The modified so that it cannot participate in the disulphide bond. The modified along also comprise mutation of the IgE binding sites to reduce allergenicity. Also included are: (1) a method of making a modified anaphylactic food allergen; (2) a nucleotide molecule encoding or for causing a site specific mutation in the modified anaphylactic food allergen; (3) a nucleotide anaphylactic food allergen; (4) a method of treating the modified anaphylactic food allergen; (4) a method of treating an individual by reducing the clinical response to a natural anaphylactic food allergen is useful for preventing or treating allergic reactions associated with any natural allergen such as food, insect, rubber or preferably anaphylactic allergens. It is also useful for treating wounds in mammals such as bovine, canine, feline, captine, covine, porcine, murine or equine species. The present sequence is a contract allergen (e.g. Ara hl, hz or h3)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CCGTACAGCCCTAGTCAGGATCCGTACAGCCCTAGTCCATATGATCGGAGAGGCGCTGGA 241

The invention relates to a modified anaphylactic food allergen whose amino acid sequence is substantially identical to that of a natural capturation anaphylactic food allergen. The natural anaphylactic food allergen is includes at least one cysteine residue that participates in a disulphide bond when the natural anaphylactic food allergen is in its native conformation, except that the cysteine residue has been modified so that it cannot participate in the disulphide bond. Also included are a method of making a modified anaphylactic food allergen, a nucleotide molecule for causing a site specific mutation in a gene concoling a notitied anaphylactic food allergen, a reansgenic plant or animal expressing a modified anaphylactic food allergen, a transgenic plant or animal expressing a modified anaphylactic food allergen by administering a modified anaphylactic food allergen by administering a modified anaphylactic food allergen by administering a modified on anaphylactic food allergen by administering a modified or anaphylactic food allergen by administering a modified or anaphylactic food allergen and an isolated fragment of peanut allergen and an isolated fragment of peanut allergen and an isolated fragment of matural anaphylactic food allergen and an isolated fragment of peanut allergen and an isolated with serum individual (s) allergic to the natural anaphylactic food allergen. The invention allergen can be used for treating allergic reactions or wounds. The present sequence used for treating allergen of the invention (or its fragment).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CAGTGGGAACTCCAAGGAGACAGAAGATGCCAGAGCCAGCTCGAGAGGGCGAACCTGAGG 121

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to a novel isolated nucleic acid molecule encoding the peanut allergen Ara h I that has been identified in patients with atopic dermatities. Specifically, it refers to a monoclonal antibody enzyme-linked immunosorbant assay (ELISA) used to detect and quantify the peanut allergens, where the monoclonal antibodies have specificity for a selected peanut allergen antigen. The present invention also describes hybridomas that produce two-site monoclonal antibodies specific for a peanut allergen that can be used in an ELISA to detect and determine the concentration of a specific peanut allergen in a food product or in food processing. Furthermore, it provides an expression vector and the isolated nucleic acid or its fraction can include a diagnostic label. Accordingly, these nucleic acids are useful for obtaining diagnostics with optimal concentrations of each allergen or for developing panels of mixtures of large numbers of recombinant allergens such that it can be used in immunotherapy for the treatment of food hypersensitivity reactions. This polypeptide sequence is the peanut Ara h II allergen

This invention relates to a novel isolated nucleic acid molecule encoding the peanut allergen Ara h I that has been identified in patients with a topic dermatitis. Specifically, it refers to a monoclonal antibody enzyme-linked immunosorbant assay (ELISA) used to detect and quantify the peanut allergens, where the monoclonal antibodies have specificity for a selected peanut allergen antigen. The present invention also describes hybridomas that produce two-site monoclonal antibodies specificity for a peanut allergen that can be used in an ELISA to detect and determine the concentration of a specific peanut allergen in a food product or in food product acid or its fraction can include a diagnostic label. Accordingly, these nucleic acids are useful for obtaining diagnostics with optimal concentrations of each allergen or for developing panels of mixtures of large numbers of recombinant allergens such that it can be used in immunotherapy for the treatment of food hypersensitivity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  241
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            102
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  361

```
The present sequence is that of the peanut allergenic protein (AP) encoded by the Ara h2 gene (see AAF90336). The invention relates to a method for producing a peanut plant having reduced, or underectable, AP content in its seed. A peanut plant having reduced, or underectable, AP construct containing an antisense AP gene and/or sense AP gene, or their fragments, regenerated to plants, and fertile transgenic plants that produce seeds with reduced AP content are identified. The AP sense or antisense gene may comprise at least a portion of the Ara h2 gene sequence. The seeds are useful for preparation of allergen-free foods. Recombinant AP may be produced and used to produce antibodies useful for detecting AP in foods, and for treatment or prevention of peanut allergy. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           12 CCCTGCGAGCAACATCTCATGCAGAAGATCCAACGTGACGAGGATTCATATGAACGGGAC 181

animal from allergic reaction, particularly using a modified allergen which is less reactive with IgE. The invention may also be used to ensure that the allergen is not introduced into genetically modified food. The present sequence represents an Aza h 2 protein fragment. (Updated on 17-OCT-2003 to standardise OS field)

The Ara H 1 allergen is found to contain 23 linear IgE-binding epitopes. The invention also provides an isolated recombinant peanut allergen designated Ara h 3 and a nucleotide molecule encoding the peanut allergen Ara h 3. Molecules of the invention are used to protect a host

This invention relates to a novel isolated nucleic acid molecule encoding the peanut allergen Ara h I that has been identified in patients with atopic dermatitis. Specifically, it refers to a monoclonal antibody encyme-linked immunosorbant assay (ELISA) used to detect and quantify the peanut allergens, where the monoclonal antibodies have specificity for a selected peanut allergen antigen. The present invention also describes by bridomas that produce two-site monoclonal antibodies specific for a peanut allergen that can be used in an ELISA to detect and determine the concentration of a specific peanut allergen in a food product or in food processing. Furthermore, it provides an expression vector and the isolated nucleic acid or its fraction can include a diagnostic label. Accordingly, these nucleic acids are useful for obtaining diagnostics with optimal concentrations of each allergen or for developing panels of mixtures of large numbers of recombinant allergens such that it can be used in immunotherapy for the treatment of food hypersensitivity reactions. This polypeptide sequence is the deduced peanut Ara h II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                241

The invention relates to a non-naturally occurring protein or polypeptide

(I) modified by recombinant DNA techniques comprising: a C-terminal

CC element comprising an II-key motif; and an intervening element comprising

c element comprising an II-key motif; and an intervening element comprising

c element comprising an II-key motif; and an intervening element comprising

c a sequence of 4-11 amino acid residues where the modification by

CC recombinant DNA techniques taking place within elements (b) and (c). Also

described are methods for: suppressing or enhancing an immune response

cd interved toward an MHC (major histocompatibility complex) Class II-

CC presented epitope of intervest. Suppressing an immune response directed

c nucleic acid sequence encoding the MHC Class II-presented epitope of

c intervest, the nucleic acid sequence encoding an Ii-key motif located 4-11

cc presented epitope of intervest; and modifying the II-key motif class II-

crass II-presented epitope of intervest, the nucleic acid sequence encoding the MHC

CC presented epitope of intervest, the nucleic acid sequence lacking

cc its conformance to the archerypal II-key regulatory motif. Enhancing an

cimmune response directed toward an MHC Class II-presented epitope of

cincervest comprises: providing a nucleic acid sequence encoding the MHC

Class II-presented epitope of intervest, the nucleic acid sequence lacking

cc class II-presented epitope of intervest, and modifying

creatiue of the MHC Class II-presented epitope of intervest; and modifying

creatiue of the MHC Class II-presented epitope of intervest; and modifying

colypeptide of intervest corresponds to a protein or polypeptide

cp polypeptide of intervest corresponds to a protein or polypeptide

cp polypeptide of intervest corresponds to a protein or polypeptide

columnations partogen selected from anthrax, EBOLA, HIV or influenza,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     fundas;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     asthma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New non-naturally occurring protein or polypeptide modified by recombinant DNA techniques, useful for treating multiple sclerosis, diabetes mellitus, myasthenia gravis, scleroderma, allergic rhinitis, colitis, cancer or psoriasis.
                                                                                                                                                                                                                                                                                                                                                           Antibacterial, Virucide, Fungicide, Antiparasitic, Antiarthritic, Antirheumatic, Neuroprotective, Antiinflammatory, Dermatological, Immunosuppressive, Antidiabetic, Antithyroid, Antiasthmatic; Antiallergic, Cytostatic, Antipsoriatic; Gene Therapy, Vaccine, Antiallergic, Grostatic, Antipsoriatic; Gene Therapy, Vaccine, MHC Class II; Ii-key motif; immune response; anthrax; EBOLA; HIV; influenza; vaccinia virus; infection, bacterium, virus; parasite; frickettsia; rheumatoid arthritis; multiple sclerosis; lupus erythematosus; diabetes mellitus; myasthenia gravis; autoimmune thyroiditis; scleroderma; dermatomyositis; pemphigus; as allergic rhinitis; topical dermatitis; colitis; cancer; psoriasis; adenoma; peanut; Ara h 2.

preferably vaccinia virus. The non-naturally occurring protein or to a Dolypeptide (1) modified by recombinant DNA techniques is useful for treating infectious diseases caused or associated with infectiou by a bacterium, virus, parasite, fungus, rickettsia or other infectious agents. It is also useful for treating rheumatoid arthritis, unltiple sclerosis, lupus erythematosus, diabetes mellitus, myasthenia gravis, autoimmune thyroiditis, scleroderma, dermatomyositis, pemphigus, asthma, allergic rhinitis, topical dermatitis, colitis, cancer, psoriasis or adenomas. The present sequence represents the amino acid sequence of a peanut allergen Ara h 2 MHC class II-presented epitope used in the invention.

The invention relates to a modified anaphylactic food allergen has an amino acid sequence that is substantially identical to that of natural anaphylactic food allergen, except for a cysteine residue that has been modified so that it cannot participate in the disulphide bond. The conditions may also comprise mutation of the IgE binding sites to reduce allergenicity. Also included are: (1) a method of making a condition of the IgE binding sites to reduce allergenicity. Also included are: (1) a method of making a condition of the IgE binding sites to reducing a site specific mutation in the modified anaphylactic food allergen; (3) a transgenic plant or animal expressing the modified anaphylactic food allergen; (4) a method of treating an individual by reducing the clinical response to a natural anaphylactic food allergen; (5) a nathod of treating an individual by reducing the clinical response to a natural anaphylactic food allergen; (6) a mathod of treating an individual by capacitic food allergen; (7) and an isolated fragmen of useful for preventing or treating allergen; canchine, murine or equine species. The subso useful for treating wounds in mammals such as bovine, canine, feline, caprine, conine, murine or equine species. The present sequence is not shown in the specification but was created by the indexer using information provided in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    241

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel antigen presentation enhancing hybrid polypeptide. The novel polypeptide has an N-terminal element consisting of 4-16 residues of a mammalian li-Key peptide and its non-N-terminal deletion modifications, a chemical structure covalently linking the N-terminal element to an MHC class II-presented epitope of a C-terminal element to an antigenic epitope, which binds to an antigenic peptide binding site of an MHC class II molecule. The antigen presentation enhancing hybrid polypeptide has the following activities: antibacterial, virucide, fungicide, antirheumatic, activities: antibacterial, virucide, fungicide, antirheumatic, antiarbritic, neuroprotective, dermacological, immunosuppressive, antidiabetic, and antichyroid. The antigen presentation enhancing hybrid polypeptide is useful for modulating the immune response in an individual and for treating infections (such as bacteria, virus, parasite and fungus), rheumatoid arthritis, multiple sclerosis, lupus parasite and fungus), and pemphigus. This sequence thyroiditis, scleroderma, dermatromyositis and pemphigus. This sequence thyroiditis, scleroderma, dermatromyositis and pemphigus. This sequence thyroiditis, scleroderma, dermatromyositis and pemphigus. This sequence

New modified anaphylactic food allergen, useful for preventing or treating allergic reactions associated with e.g. anaphylactic allergens.

Example 13; Page; 300pp; English.

The invention relates to a modified anaphylactic food allergen has an amino acid sequence that is substantially identical to that of natural anaphylactic food allergen, except for a cysteine residue that has been modified so that it cannot participate in the disulphide bond. The modification may also comprise mutation of the IgE binding sites to creduce allergenicity. Also included are: (1) a method of making a modified anaphylactic food allergen; (2) a nucleotide modecule encoding or for causing a site specific mutation in the modified anaphylactic food allergen; (4) a method of treating an individual by reducing the clinical response to a natural anaphylactic food allergen; (5) anaphylactic food allergen; (6) a natural anaphylactic food allergen; (7) a naphylactic food allergen; (8) a method of treating or treating allergen; canaphylactic food allergen; (9) a natural anaphylactic food allergen; (7) a cactions associated with any natural allergen such as food, insect, rubber or preferably anaphylactic allergens uch as food, insect, rubber or preferably anaphylactic allergens. The present sequence is a food or allergen, mutated to alter its IgE binding characteristics. Note: The present sequence is not shown in the specification but was created by the indexer using information provided in the specification.
